

3D/4D "Baby Portraits"

Dear Expectant Mom:

With our new ultrasound equipment, we have the capability to provide "Baby Portraits" using 3D/4D images of your baby. This non-medical sonogram is accomplished solely for the purpose of entertainment, and will NOT provide any additional medical information. Subsequently, it can NOT be accomplished during your regular sonogram.

The best time to perform 4D imaging is between 27 and 31 weeks, and our sonographers can advise you about the procedure limitations (baby position, fluid amount, etc.). If you have questions, or would like to schedule a 4D sonogram, please call our Baby Line (799-BABY) and ask to make an appointment, or ask the next time you're "checking-out" in the OB Suite. We have a limited number of appointments so please schedule early. We hope you'll understand that on a rare occasion, a medically necessary ultrasound for another patient might interfere with your "Baby Portrait" appointment.

You will receive a CD of the 3D images, as well as, a color photo and several black and white photos. The cost of this service is payable at the time of service. Since the "Baby Portrait" is not a medically necessary procedure, it is not reimbursed by insurance companies.
